Research Profile

Contributions to the theory and computation of Partial Differential Equations (PDEs) with diverse applications to *shock waves*, *kinetic transport*, *incompressible flows*, image processing, and self-organized collective dynamics. In particular — contributions to the development of high-resolution methods for nonlinear conservation laws, including those associated with the notions of • *central schemes* • *entropy conservative schemes* • *spectral viscosity methods* • *constraint transport* and • *edge detection*. Rigorous derivation of transport models and their relation to kinetic theories, and of *critical thresholds* phenomena in such models. Development of multi-scale *hierarchical decompositions* of images and solutions to PDEs with critical regularity. Modeling and analysis of collective dynamics with applications to *flocking* and *opinion dynamics*.
